The Price of Prestige

REVIEW DRAFT | TEAM CONTRIBUTIONS PENDING

G1 - ACM Code of Ethics Case Study (Twine)

Source case: ACM, *Abusive Workplace Behavior*.

acm.org/code-of-ethics/case-studies/abusive-workplace-behavior

Team member	Supplied role
Kazi Boni Amin	Programmer and art designer
Krrish Setia	Main writer
Andy Wang	Editor and secondary writer

1. Scenario Description

Diane, a new graduate, joins a prestigious augmented reality research team. Its technical lead, Max, humiliates staff over mistakes, while research manager Jean protects his reputation and the funding he attracts. A tracking defect before a sponsor demonstration tests Diane's willingness to seek review. When Max removes Diane and coworker Eli from a paper that uses their work, she must balance earned credit, financial stability, Eli's wishes, and institutional accountability. HR adviser Priya explains possible responses without promising a finding. Four decision stages lead to five outcomes that preserve both gains and unresolved costs.

Adaptation and scope

The handoff identifies Diane, Max, Jean, the AR setting, workplace abuse, and punitive credit removal as the original premise. This adaptation adds Eli and Priya, specific technical review consequences, documentation and consent choices, a fictional reporting process, and five distinct endings. All game dialogue is newly authored for this build; no source quotations are claimed.

The implemented story uses Harlowe 3.3.9, 25 navigable passages, a shared header passage, four main decision stages, and five endings. The separate test report records performed checks and limitations.

Review status

Actual section contribution percentages and ownership of perspective-elements are awaiting team confirmation. Known roles do not establish percentages or authorship. See Section 6 for the precise missing facts. This document is a review candidate, not a claim of team approval.

PERSPECTIVES / MOTIVATIONS / INTERACTIONS

2. Characters

Diane | player

A new graduate who values learning, rent-paying stability, and fair recognition. The player chooses her response to humiliation, the defect, research credit, and the future. Her technical responsibility does not make her responsible for Max's abusive choices.

Max | technical lead

An acclaimed AR researcher who equates deadlines and prestige with authority. He insults Diane, blames Eli, and uses authorship as punishment. His expertise explains his power without excusing the abuse. He directly responds to technical and credit decisions.

Jean | research manager

Fears losing funding and irreplaceable technical leadership. On the Jean route she dismisses Diane's concern; on every route she is copied on the credit decision. She acknowledges a written objection only if Diane sends one, and permits peer practices for productivity while protecting Max.

Eli | coworker

Wants reliable work and earned credit but fears retaliation. He reviews the defect with Diane when asked, explains the costs of secrecy or public blame, and voices his own reporting boundaries. After paired review he may authorize a specific named statement; Diane can still choose to leave it private.

Priya | HR adviser

Works outside Jean's reporting line and explains this fictional company's review, interim support, and transfer options. She distinguishes an options conversation from a formal report, accepts Diane's own observations without requiring Eli's participation, and cannot guarantee secrecy or a particular finding.

Perspective boundaries

Diane can protect herself without being framed as cowardly. Eli is a person with choices rather than a resource to unlock an ending. Jean and Max have intelligible incentives, but those incentives are not ethical justification. Priya offers a constrained process rather than a guaranteed rescue.

FOUR DECISION STAGES

3. Ethical Dilemmas

- **Speak up, document, or protect an immediate position.** Tell Jean to seek supervisory intervention, even though Diane risks dismissal of her concern; record the incident while fresh to preserve a specific factual account, although a record alone brings no immediate protection; or remain quiet for now because Diane needs the job and fears becoming a target. The merged Defect scene remembers which response occurred. Only Record creates the contemporaneous outburst note.

- **Reliable review under fear of blame.** Ask Eli to review and test a fix together because his expertise may expose a faulty assumption; this costs a morning and builds trust. Attempt a rushed solo repair to avoid exposing Eli or missing the deadline; inadequate review causes a reset regression, followed by rollback, a reviewed correction, and a two-day delay. Raise the defect openly to make the risk visible; Max targets Eli, while the team performs a focused review and delays a day. Reporting a defect never makes Diane responsible for Max's abuse.

- **Earned credit, another person's agency, and career security.** Challenge the author list with permitted contribution records to defend recognition, despite further hostility. Alternatively, support Eli privately and ask what he wants shared: after Pair he permits a named statement for Priya, and Diane can accept that scope or leave him to send it himself; after Solo or Open he declines a statement. Accept the omission for now to avoid confrontation and preserve a reference or paycheque. Support is not evidence collection, and Eli's refusal does not stop Diane reporting her own experience.

- **Longer-term accountability and uncertain costs.** File a factual formal report to seek external review of the management chain; its outcome depends on the authored information route and can remain unresolved. Request a transfer to protect well-being while giving up the prestigious research post; optionally leave an account of Diane's own experience, without treating it as a formal complaint. Stay and build peer review and a contribution ledger to improve what coworkers can control, while leadership remains unresolved. Keep working without further action to preserve immediate stability, leaving fear and unfair credit in place. None of these choices transfers responsibility for abuse from Max to Diane.

Every ending asks a route-specific ethical question. Earlier choices change later text or outcomes even when passages merge. There is no moral score and no universally rewarded answer.

WHAT THE PLAYER SHOULD BE ABLE TO EXPLAIN

4. Lesson Goals

1. Distinguish constructive criticism from abuse

Compare fixing the calibration labels and reviewing the tracker with Max's attacks on a person's worth. The correction is needed; humiliation is not. Ask what useful feedback would have sounded like in Outburst or Solo.

2. Compare self-protection, support, and reporting under uncertainty

Contrast Report, Exit, Peers, and Silence. Consider what each preserves and leaves unresolved, and why Eli's statement is voluntary. The endings invite reflection rather than awarding a moral score.

3. Explain why mistakes do not cancel earned research credit

Credit uses the same contributions after both competent review and a rushed error. Challenge records an objection; E1 restores credit while E3-E5 can leave the old paper unresolved. A contribution is not a reward for obedience.

4. Explain leadership's effect on working conditions and quality

Connect fear-driven secrecy in Solo with review and learning in Pair and Peers. Jean's incentives protect Max, while E4 shows that local technical gains do not establish institutional accountability.

How the ACM principles are applied

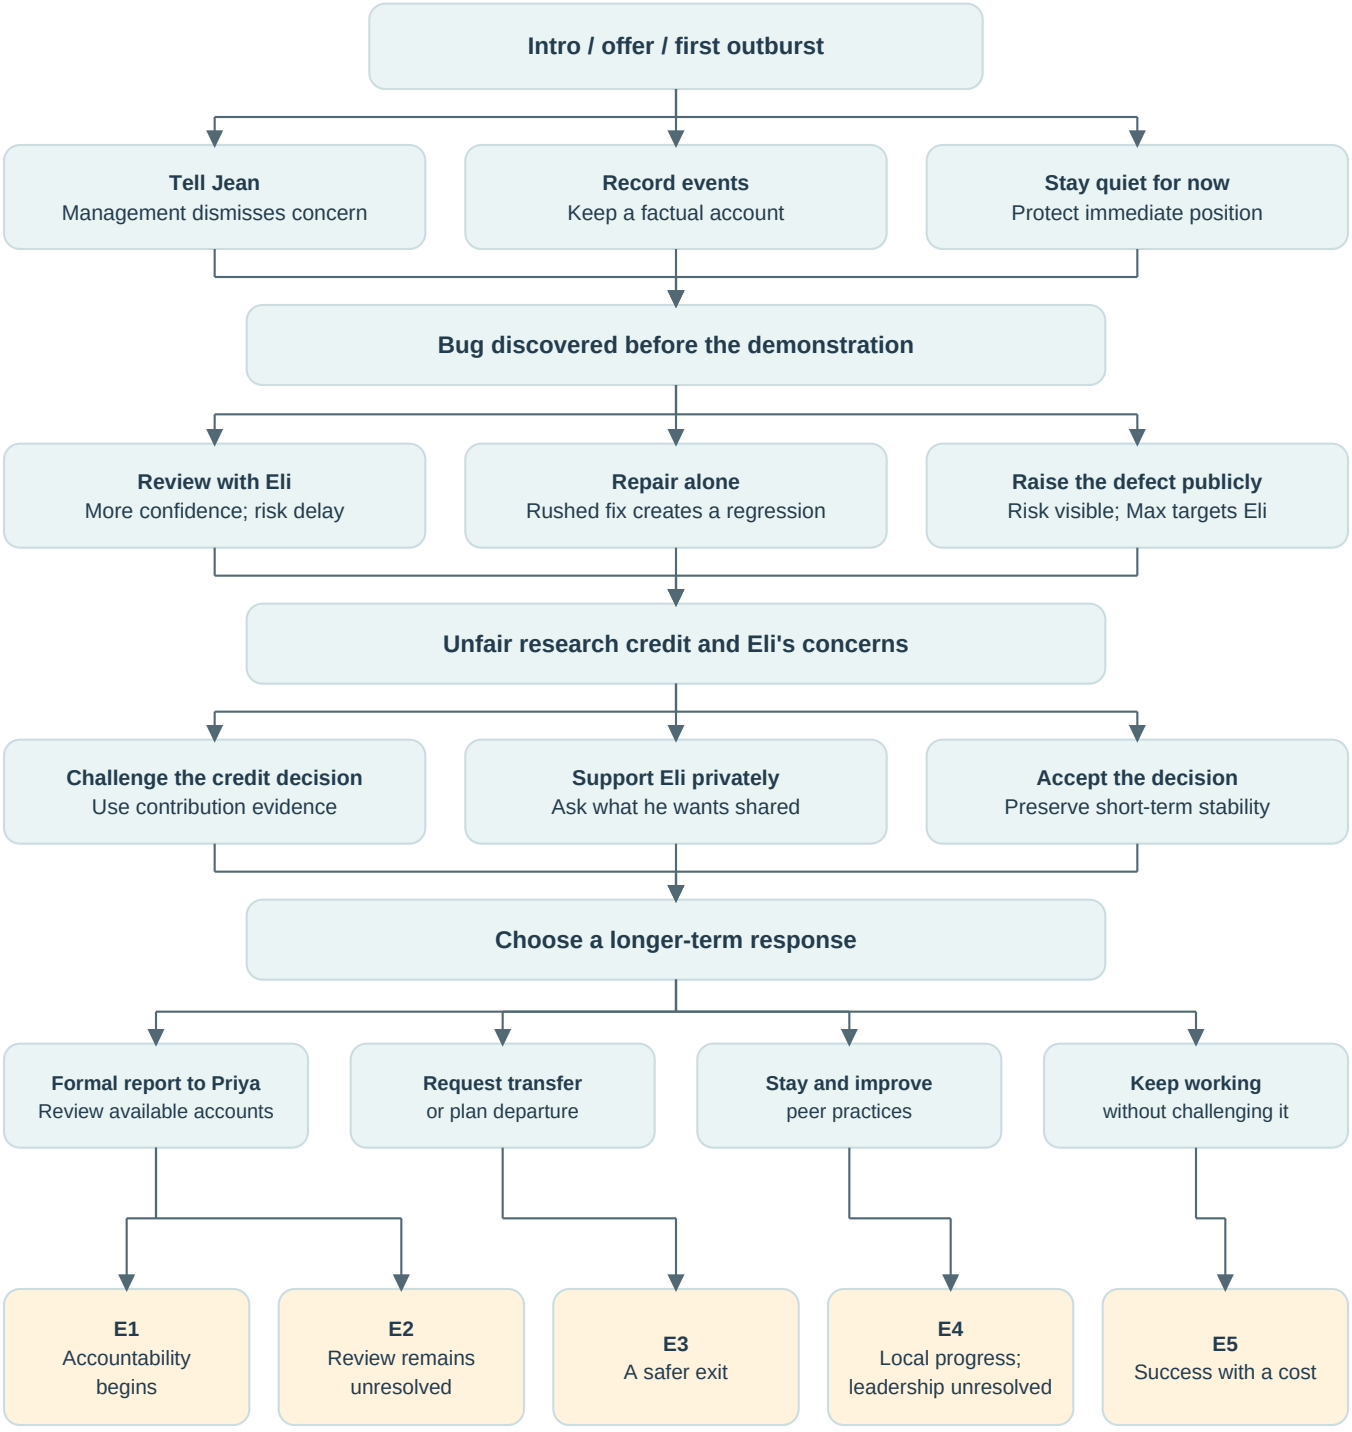
Principle	Application in this adaptation
1.2 / 1.4	Reducing harm and treating people fairly inform the response to intimidation and abuses of authority.
1.5	Authorship should recognize real work; mistakes do not erase completed contributions.
2.4 / 2.6	Constructive review and recognizing the need for expertise counter fear-driven isolated work.
3.3 / 3.4	Leaders are responsible for working conditions and organizational processes that make ethical commitments usable.

These are paraphrased applications, not quotations. The accessible ACM chapter index supports the principle headings; direct access to the main case and Code pages was blocked. See the source note in Section 6.

GENUINE PRE-IMPLEMENTATION SKETCH

5. Story Flow | proposed

Redrawn from page 3 of the supplied initial design PDF. Boxes represent proposed stages, not final passage names. The initial PDF is preserved unchanged in the review package.

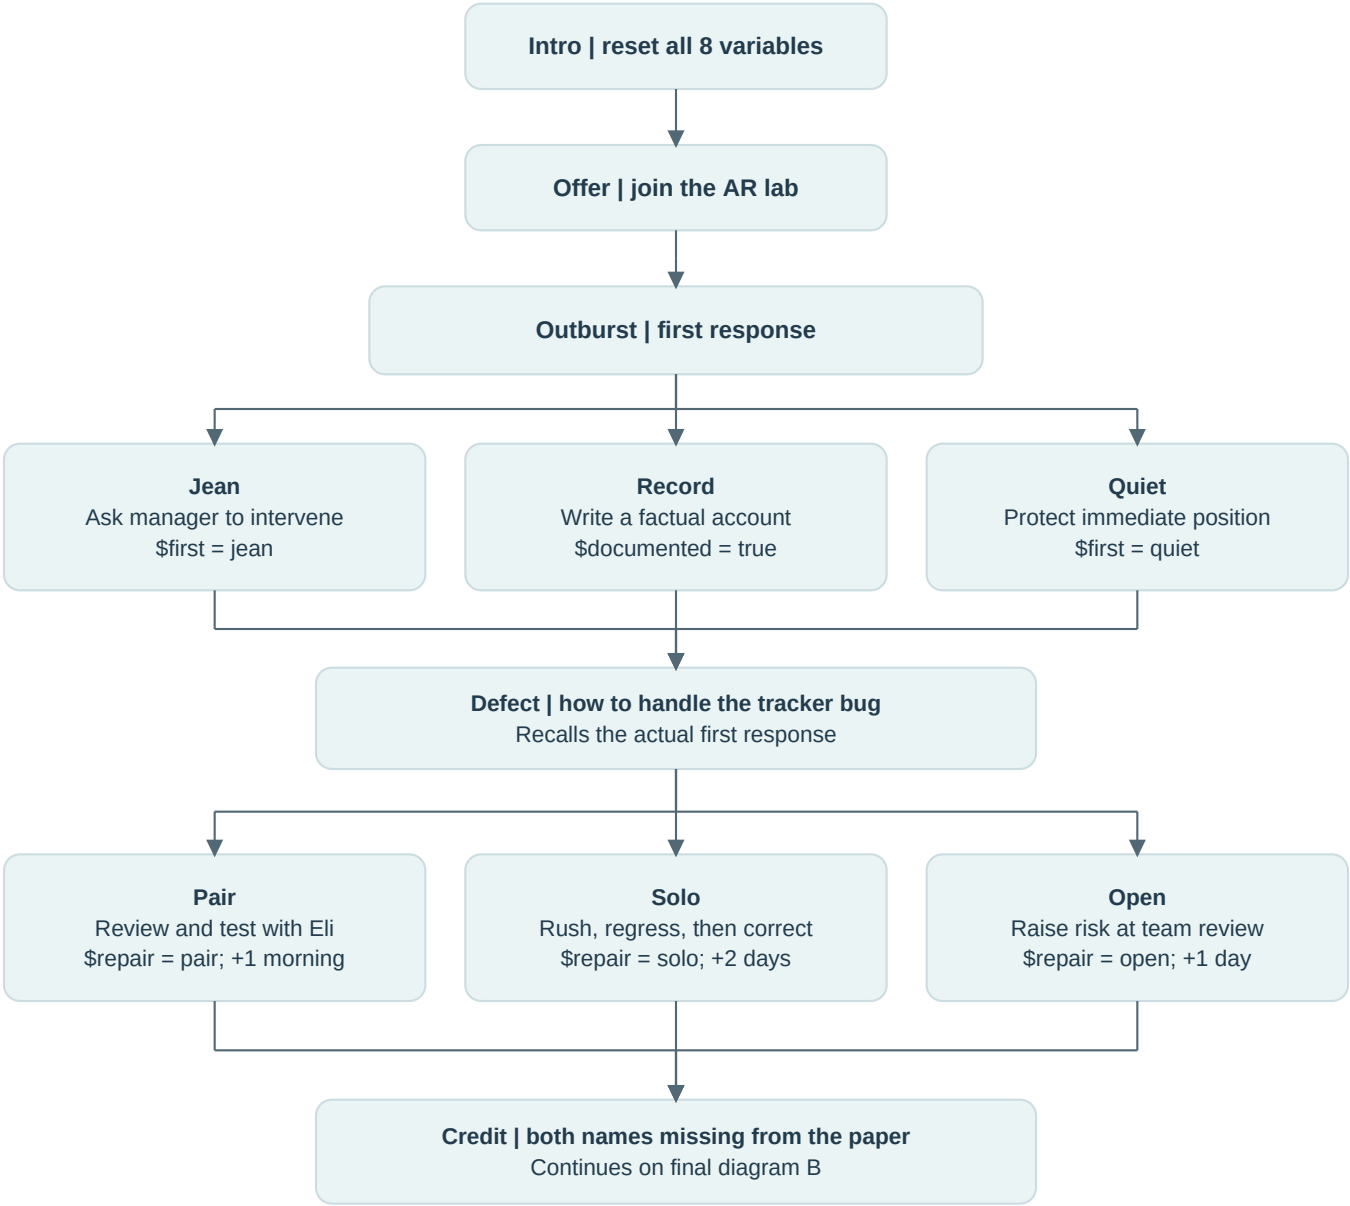


Original annotations: report outcomes depend on information and corroboration, with no guaranteed victory. Endings include ACM reflections and restart. Separate final diagrams follow.

IMPLEMENTED PASSAGES / FIRST RESPONSE AND TECHNICAL WORK

5. Story Flow | final A

Each box names an actual passage. Arrows follow compiled links; box descriptions label the important choices. The shared Frame header renders automatically and is omitted from navigation.



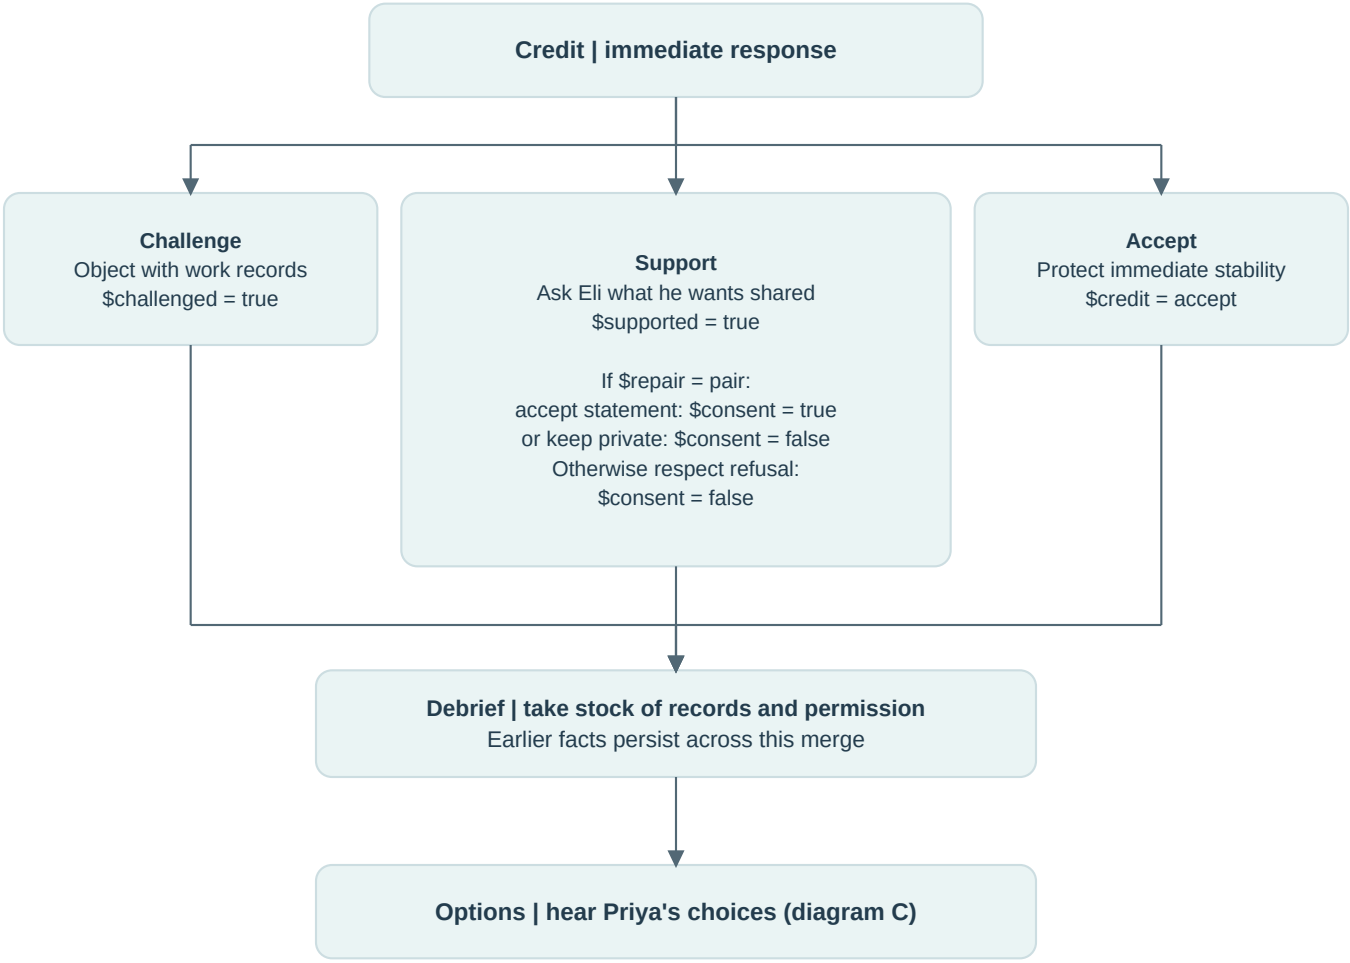
Unchanged: the three responses to abuse and the three approaches to the defect remain as proposed. **Made concrete:** Intro and Offer are separate passages; the first response is remembered in Defect; every repair route states its testing and delay. A solo regression is corrected before any successful demo.

Notation: $names are internal Harlowe state, not a player-visible score. Record also sets $first = record. No other first response creates an outburst record.

IMPLEMENTED PASSAGES / CREDIT, CONSENT, AND OPTIONS

5. Story Flow | final B

The three immediate credit responses remain. The Support passage now has explicit conditional choices, followed by a separate Debrief and an options conversation with Priya.



Conditional links within Support

After Pair, Eli authorizes only a named statement for Priya. The player may accept the permission ($consent = true) or keep it private ($consent = false). After Solo or Open, Eli refuses a private statement and the only continuation respects that boundary. All three displayed variants lead to Debrief; they are distinct tested-choice targets even though the destination is the same.

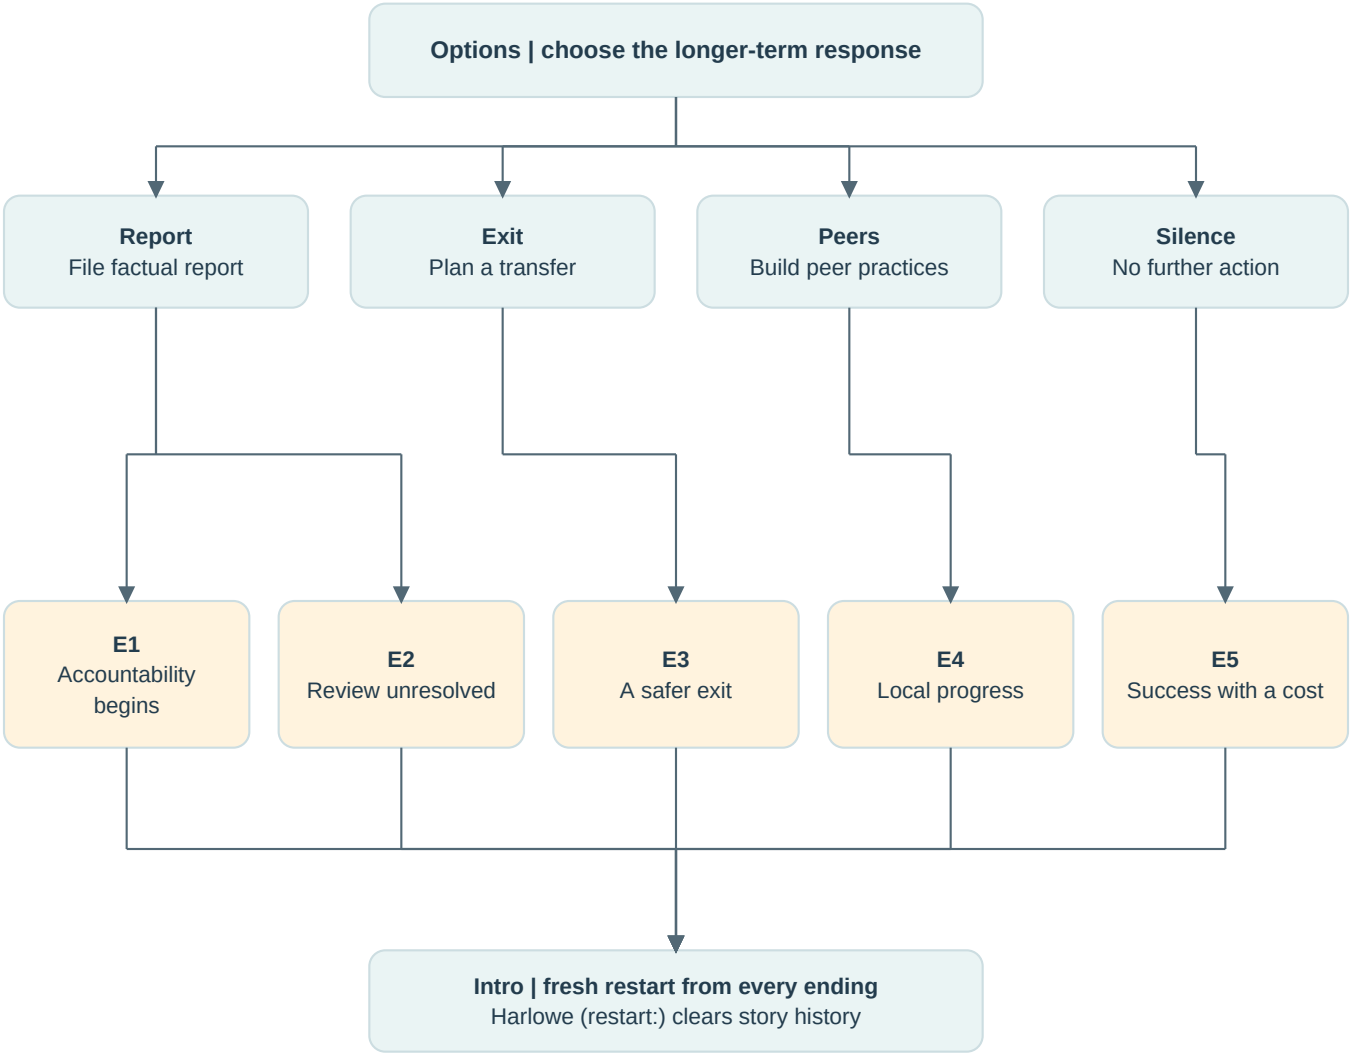
Annotation: Challenge sets $credit = challenge; Support sets $credit = support; Accept sets $credit = accept. Only Challenge sets $challenged. Only Support sets $supported. Debrief separates the outburst note, the authorship objection, and Eli's private account.

Added precision: a limited consent decision and an evidence summary replace an implicit assumption that supporting Eli always provides a statement. Hearing Priya's options is not filing a complaint.

IMPLEMENTED PASSAGES / RESPONSES AND FIVE ENDINGS

5. Story Flow | final C

Four longer-term responses and all five planned outcome concepts are retained. Every ending includes a reflection and a true restart.



State-dependent routes and in-passage choices

Report to E1: ($documented and $challenged) or $consent. **Report to E2:** otherwise. This is an authored fictional branching rule, not a prediction of a real HR process. E1 without Eli's statement includes Jean separately confirming the deferral of the written authorship objection.

Exit to E3: choose a factual exit account ($exitAccount = true) or transfer without it (false). Both reach E3, whose account text changes. The implemented exit is a confirmed transfer after handover; a job search is the contingency discussed in Exit.

FIVE DISTINCT OUTCOMES / NO GUARANTEED CLEAN VICTORY

5. Story Flow | consequences

E1 | Accountability begins

An independent review restores earned credit and an experienced interim supervisor handles daily reviews. The milestone moves and trust remains damaged. Eli's authorized statement can corroborate the account; without it, the dated note plus written objection leads to a separate confirming interview with Jean. ACM 1.5, 3.3, 3.4.

E2 | Review unresolved

Interviews conflict and some colleagues will not speak on the record. The author list remains under review; an outside supervisor provides interim distance while Diane keeps her salary. Unresolved does not mean false. ACM 1.2, 3.4.

E3 | A safer exit

A transfer follows a two-week handover, preserving salary while costing the particular research opportunity. A voluntary exit account may be retained; it does not trigger a promised full review. Max still leads the old group. ACM 1.2, 3.3.

E4 | Local progress

Peer review catches a later error and a contribution ledger improves traceability. The old credit dispute and Max's authority persist; people still tense when he enters. ACM 2.4, 2.6, 3.3, 3.4.

E5 | Success with a cost

The sponsor demo succeeds using a reviewed repair, with the route's stated delay. Funding and pay continue while unfair credit and fear remain. Earlier challenge or support changes the personal consequence. ACM 1.4, 1.5.

What changed, and what did not

The revised proposal's four-stage structure and five ending concepts remain intact. The build adds explicit consent and exit-account choices, separate Debrief and Options passages, concrete repair delays, and a precise report guard. The older outline's automatic lawsuit payout, graduate-to-lead promotion, team collapse, and inconsistent Ada naming are absent. Those were already rejected by the revised proposal, not new post-build discoveries.

WHY MERGED PASSAGES REMEMBER CHOICES

5. Story Flow | state contract

State and initial value	Set by / persistent consequence
$first = none	Jean, Record, or Quiet identifies the first response. Defect and Debrief recall only conversations that occurred.
$documented = false	Record sets true. Debrief and Report distinguish a fresh note from recollection. With $challenged, enables the E1 report route without Eli.
$repair = none	Pair, Solo, or Open records the technical route. Credit, Support, Peers, Silence, and endings carry review, trust, repair, or delay consequences.
$credit = none; $challenged = false	Challenge sets credit=challenge and challenged=true. Support/Accept set the corresponding credit label. The challenged flag preserves the objection in Debrief, Report, and E3-E5. $credit is an explicit route record; the matching flags drive the prose.
$supported = false	Support sets true. Peer cooperation and exit/ending text recall the private conversation without inventing a statement.
$consent = false	Only Pair followed by Support and acceptance of the scoped permission sets true. Report shares only that account. It provides an alternate route to E1.
$exitAccount = false	Exit explicitly sets true or false before E3, changing what Priya retains.

Reset and implementation discipline

Intro initializes all eight variables. Each ending uses Harlowe's (restart:) macro, returning to fresh initialization and clearing story history. The canonical Twee source supplies the HTML build; graph.json is generated from its passage links. The final diagrams assert that every distinct source-to-destination pair in graph.json is represented across A-C.

Repeated destination links in Support and Exit are annotated explicitly rather than drawn as overlapping arrows. The Mermaid export retains every compiled edge. Report guards are read from the implemented story and stated above; a plain graph edge alone does not imply unconditional reachability.

Visual and interaction design

The AR-office interface uses labelled green choices for support or protection, amber for uncertain tradeoffs, and red for heightened risk or continuing harm. Scene backgrounds echo the situation. Ending screens use green for accountability, teal-green for a safer exit or local progress, amber for unresolved review, and red for success with continuing harm. Text labels and reflections preserve the tradeoffs; colour is not a guarantee or moral score. System fonts, readable line lengths, speaker labels, and visible keyboard focus support navigation. It has no timer, moral-score meter, remote media, or external instructions required to play. The full Harlowe runtime is embedded in the playable HTML.

REAL CONTRIBUTIONS / CONFIRMATION REQUIRED

6. Team Contributions

The supplied roles on page 1 are known. They do not establish actual percentages or who developed a particular perspective. Proposed allocations in the initial plan are not evidence of completed work.

Design section	Kazi Boni Amin	Krrish Setia	Andy Wang	Actual total	Required total
Scenario Description	Pending	Pending	Pending	Pending	100%
Characters	Pending	Pending	Pending	Pending	100%
Ethical Dilemmas	Pending	Pending	Pending	Pending	100%
Lesson Goals	Pending	Pending	Pending	Pending	100%
Story Flow	Pending	Pending	Pending	Pending	100%

Perspective-element ownership

Kazi Boni Amin: Awaiting team confirmation: identify the perspective-element actually contributed and a specific example or passage.

Krrish Setia: Awaiting team confirmation: identify the perspective-element actually contributed and a specific example or passage.

Andy Wang: Awaiting team confirmation: identify the perspective-element actually contributed and a specific example or passage.

Exactly what the team needs to supply

Provide each member's actual percentage for each of the five rows, with every row totaling 100%, and identify each person's actual perspective-element(s), with a concrete passage or example. Edit source/team_contributions.csv and source/perspective_notes.json, then rerun source/generate_pdf.py. Blank data remains visibly pending; the script validates completed percentage rows and does not invent missing values.

Sources and attribution

Primary assignment authority: the supplied reference/04_assignment_and_rubric.txt. **Design baseline:** 05_revised_build_spec.md and the unchanged five-page G15_Initial_Design_and_Build_Plan.pdf. Earlier story, design, and feedback files provide context; the historical feedback's unverified design-section point values are not used.

ACM source case: Abusive Workplace Behavior. **Code:** ACM Code of Ethics and Professional Conduct. **Accessible principle index:** ACM chapter Code of Ethics. Direct automated retrieval of the main case and Code returned HTTP 403 during this build; the case premise is attributed using the supplied handoff. No claim is made to have read a fully retrieved case page or to quote its text.

Technical references: Twine editor reference; Harlowe manual; IF Technology Foundation Twine/Twee specifications. Local build instructions, runtime license, and actual checks accompany the package.
