The Price of Prestige

REVIEW DRAFT | TEAM CONTRIBUTIONS PENDING

G1 - ACM Code of Ethics Case Study (Twine)

Source case: ACM, *Abusive Workplace Behavior*.

acm.org/code-of-ethics/case-studies/abusive-workplace-behavior

Team member	Supplied role
Kazi Boni Amin	Programmer and art designer
Krrish Setia	Main writer
Andy Wang	Editor and secondary writer

1. Scenario Description

Diane, a new graduate, joins a prestigious augmented reality research team led by Max, whose abusive outbursts are excused by manager Jean. How Diane handles a tracking defect changes the next conflict: a rushed solo repair leads Max to remove Diane's manuscript credit while retaining Eli's; joint review preserves both names but draws a threat to future credit; public reporting preserves both names but reveals intimidation and concerns about unequal treatment of women researchers. Coworker Eli sets boundaries on what he will share, and HR adviser Priya explains possible responses without promising a finding. Players learn to separate technical responsibility from abuse and to weigh fair recognition, consent, self-protection, and accountability.

Adaptation and scope

The supplied original premise includes Diane, Max, Jean, AR research, workplace abuse, and punitive changes to research credit. This adaptation adds Eli and Priya, three route-dependent manuscript situations, documentation and consent choices, concerns about unequal treatment, a fictional reporting process, and five distinct endings. Dialogue is original to this project; no source quotations are claimed.

The implemented story uses Harlowe 3.3.9, 25 navigable passages, a shared header passage, four main decision stages, and five endings. The separate test report records performed checks and limitations.

Review status

Actual section contribution percentages and ownership of perspective-elements are awaiting team confirmation. Known roles do not establish percentages or authorship. See Section 6 for the precise missing facts. This document is a review candidate, not a claim of team approval.

PERSPECTIVES / MOTIVATIONS / INTERACTIONS

2. Characters

Diane | player

A recent graduate working on an AR research team. She values financial stability, professional development, and fair recognition. The player determines how she responds to Max's abusive behaviour, a technical defect, concerns about authorship, and the workplace environment. Diane's earlier decisions influence which later opportunities are available.

Max | technical lead

A prestigious AR researcher who uses his reputation and technical expertise to justify aggressive management. He humiliates employees, discourages criticism, and threatens research recognition. Following Diane's rushed repair, he removes her authorship despite her earlier contributions. His behaviour also raises concerns about the unequal treatment of women researchers. His expertise does not excuse workplace abuse.

Jean | research manager

The manager overseeing Max's research team. She prioritizes funding, deadlines, and Max's reputation, dismissing employee concerns rather than confronting him. She postpones Diane's written objections and permits technical improvements without fully addressing the leadership problem.

Eli | coworker

An engineer responsible for part of the AR tracking system. Max verbally humiliates him, but Eli retains his authorship throughout the story. His willingness to cooperate depends on how Diane previously treated him. He may assist with technical improvements while declining to provide a named statement. His participation in reporting is voluntary.

Priya | HR adviser

An HR adviser outside Jean's reporting line. She explains formal reporting, temporary supervision, and transfer options. She emphasizes factual evidence, confidentiality limitations, and respect for coworker consent. She cannot guarantee that an investigation will establish misconduct or produce a particular outcome.

Perspective boundaries

Diane can protect herself without being framed as cowardly. Eli is a person with choices rather than a resource to unlock an ending. Jean and Max have intelligible incentives, but those incentives are not ethical justification. Priya offers a constrained process rather than a guaranteed rescue.

FOUR DECISION STAGES

3. Ethical Dilemmas

- **Responding to abusive workplace behaviour.** Following Max's first outburst, Diane can approach Jean, document the incident, or remain quiet. Speaking to management seeks intervention but risks dismissal of her concerns. Documentation creates a contemporaneous record without immediately changing the situation. Remaining quiet protects her short-term position but leaves the misconduct unchallenged. Her response affects the information available during a later investigation.

- **Handling a technical defect under pressure.** Diane can work with Eli to review the defect, attempt a rushed repair alone, or raise the issue publicly. Joint review improves reliability and builds cooperation but delays rehearsal. A rushed solo repair introduces a regression, leading to additional testing and retaliation against Diane. Public reporting exposes the defect but provokes Max's hostility toward Eli. Each option creates different technical and interpersonal consequences.

- **Research credit, retaliation, and unequal treatment.** The manuscript conflict depends on the technical decision. After Solo, Max removes Diane's authorship while retaining Eli's. After Pair, both remain credited, but Max threatens Diane's future recognition. After Open, both retain credit, while concerns about intimidation and unequal treatment of women researchers remain. Diane can challenge the conduct with work records, seek Eli's support while respecting his consent, or avoid confrontation to preserve immediate career stability.

- **Reporting, leaving, cooperating, or remaining silent.** Diane can file a formal report, request a transfer, establish safer peer-review practices, or continue without further action. Formal reporting may produce accountability or an unresolved investigation, depending on available evidence. A transfer protects Diane but leaves the original team unchanged. A joint peer initiative requires established cooperation with Eli and cannot be selected after an unsupported solo repair unless Diane later speaks with him. Remaining silent maintains short-term stability but leaves workplace problems unresolved. Reporting and transfer remain available regardless of earlier decisions.

Every ending asks a route-specific ethical question. Earlier choices change later text or outcomes even when passages merge. There is no moral score and no universally rewarded answer.

WHAT THE PLAYER SHOULD BE ABLE TO EXPLAIN

4. Lesson Goals

1. Distinguish professional accountability from workplace abuse

Players should recognize that technical mistakes require correction and review, but they do not justify humiliation or retaliation. The Solo route demonstrates that Diane can accept responsibility for a regression while opposing the removal of earned research credit.

2. Evaluate fairness and unequal treatment in research recognition

Players should understand that authorship should reflect actual contributions rather than obedience to management. The conditional manuscript scenarios highlight retaliation, threats to future recognition, and concerns about unequal treatment of women researchers. ACM principle 1.5 emphasizes giving appropriate credit for intellectual work.

3. Understand how earlier decisions affect later opportunities

Players should observe how technical cooperation, documentation, and interpersonal trust influence later dialogue, evidence, and available actions. The joint peer initiative becomes unavailable after an unsupported solo repair unless Diane rebuilds cooperation with Eli. Reporting and transferring remain possible regardless of earlier decisions.

4. Compare ethical responses under uncertainty

Players should evaluate formal reporting, personal protection, peer cooperation, and remaining silent. Each ending involves both benefits and unresolved costs. ACM principles 1.2, 2.4, 2.6, 3.3, and 3.4 connect harm reduction, constructive review, professional responsibility, and effective organizational leadership.

How the ACM principles are applied

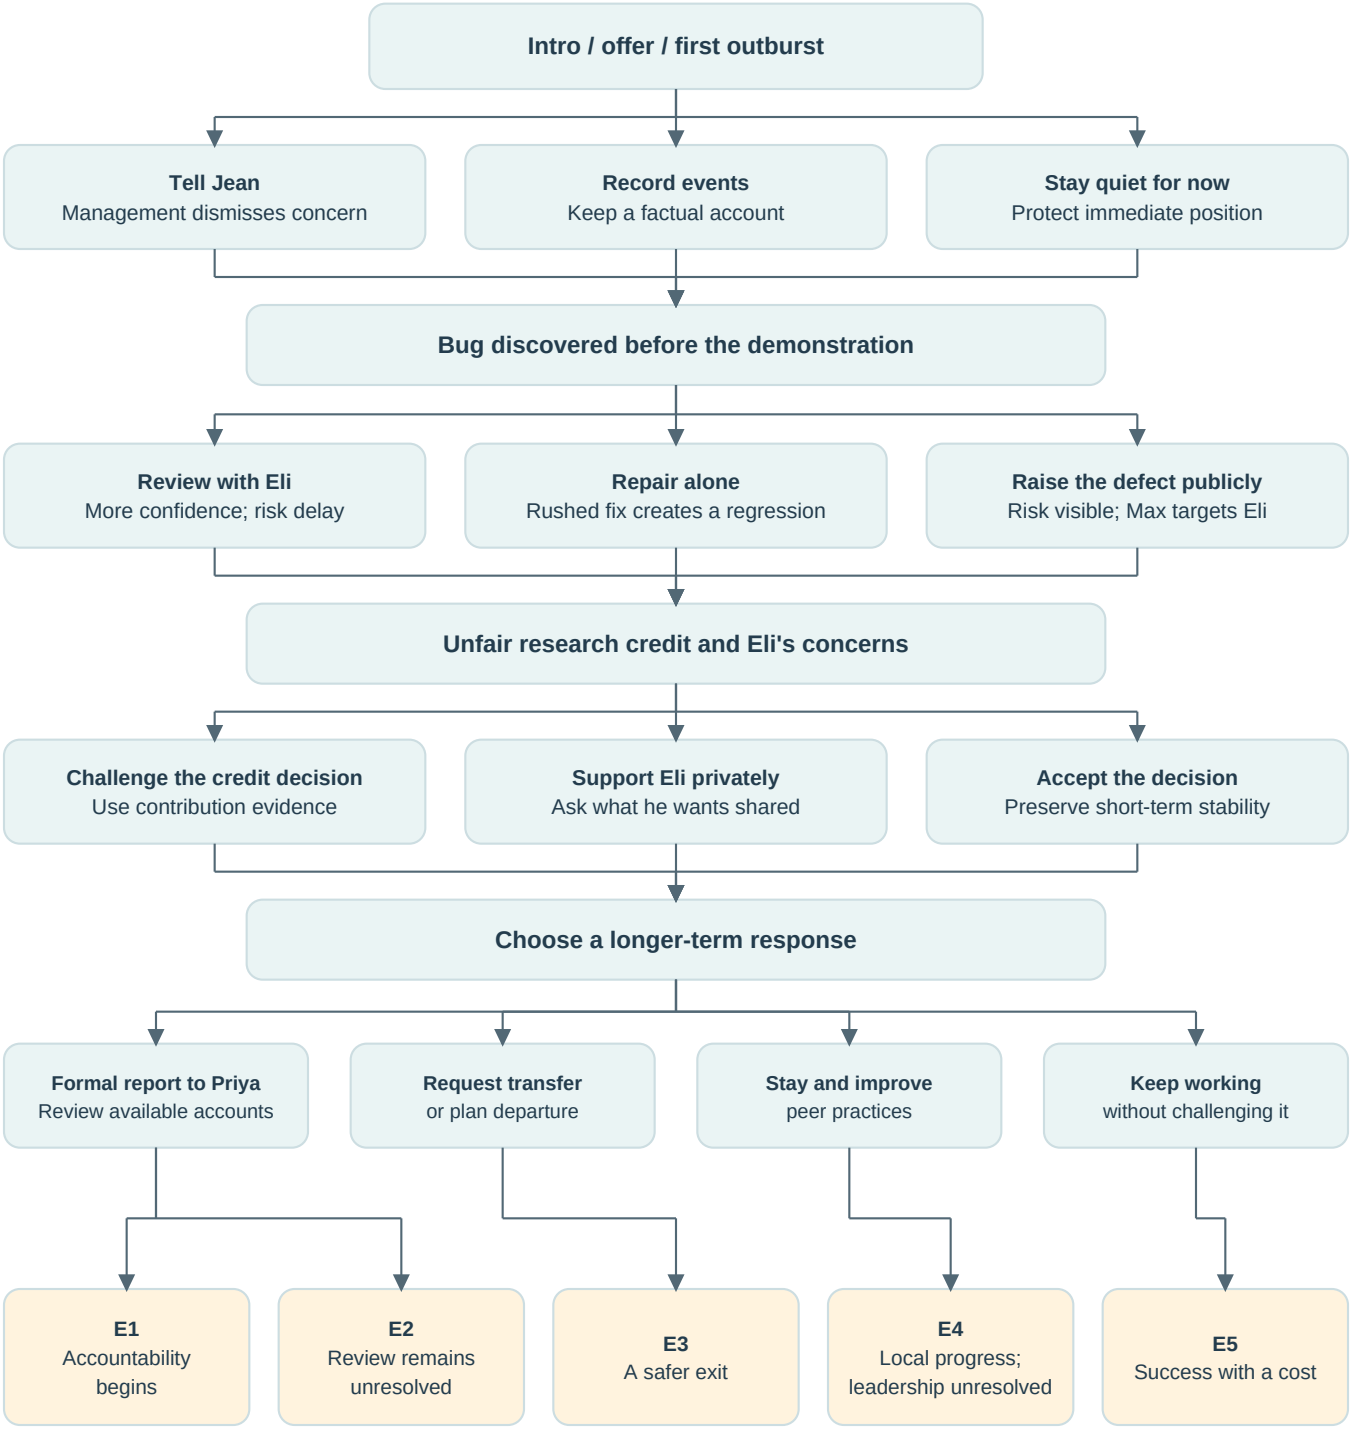
Principle	Application in this adaptation
1.2 / 1.4	Reducing harm and treating people fairly inform the response to intimidation and abuses of authority.
1.5	Authorship should recognize real work; mistakes do not erase completed contributions.
2.4 / 2.6	Constructive review and recognizing the need for expertise counter fear-driven isolated work.
3.3 / 3.4	Leaders are responsible for working conditions and organizational processes that make ethical commitments usable.

These are paraphrased applications, not quotations. The accessible ACM chapter index supports the principle headings; direct access to the main case and Code pages was blocked. See the source note in Section 6.

GENUINE PRE-IMPLEMENTATION SKETCH

5. Story Flow | proposed

Redrawn from page 3 of the supplied initial design PDF. Boxes represent proposed stages, not final passage names. The initial PDF is preserved unchanged in the review package.

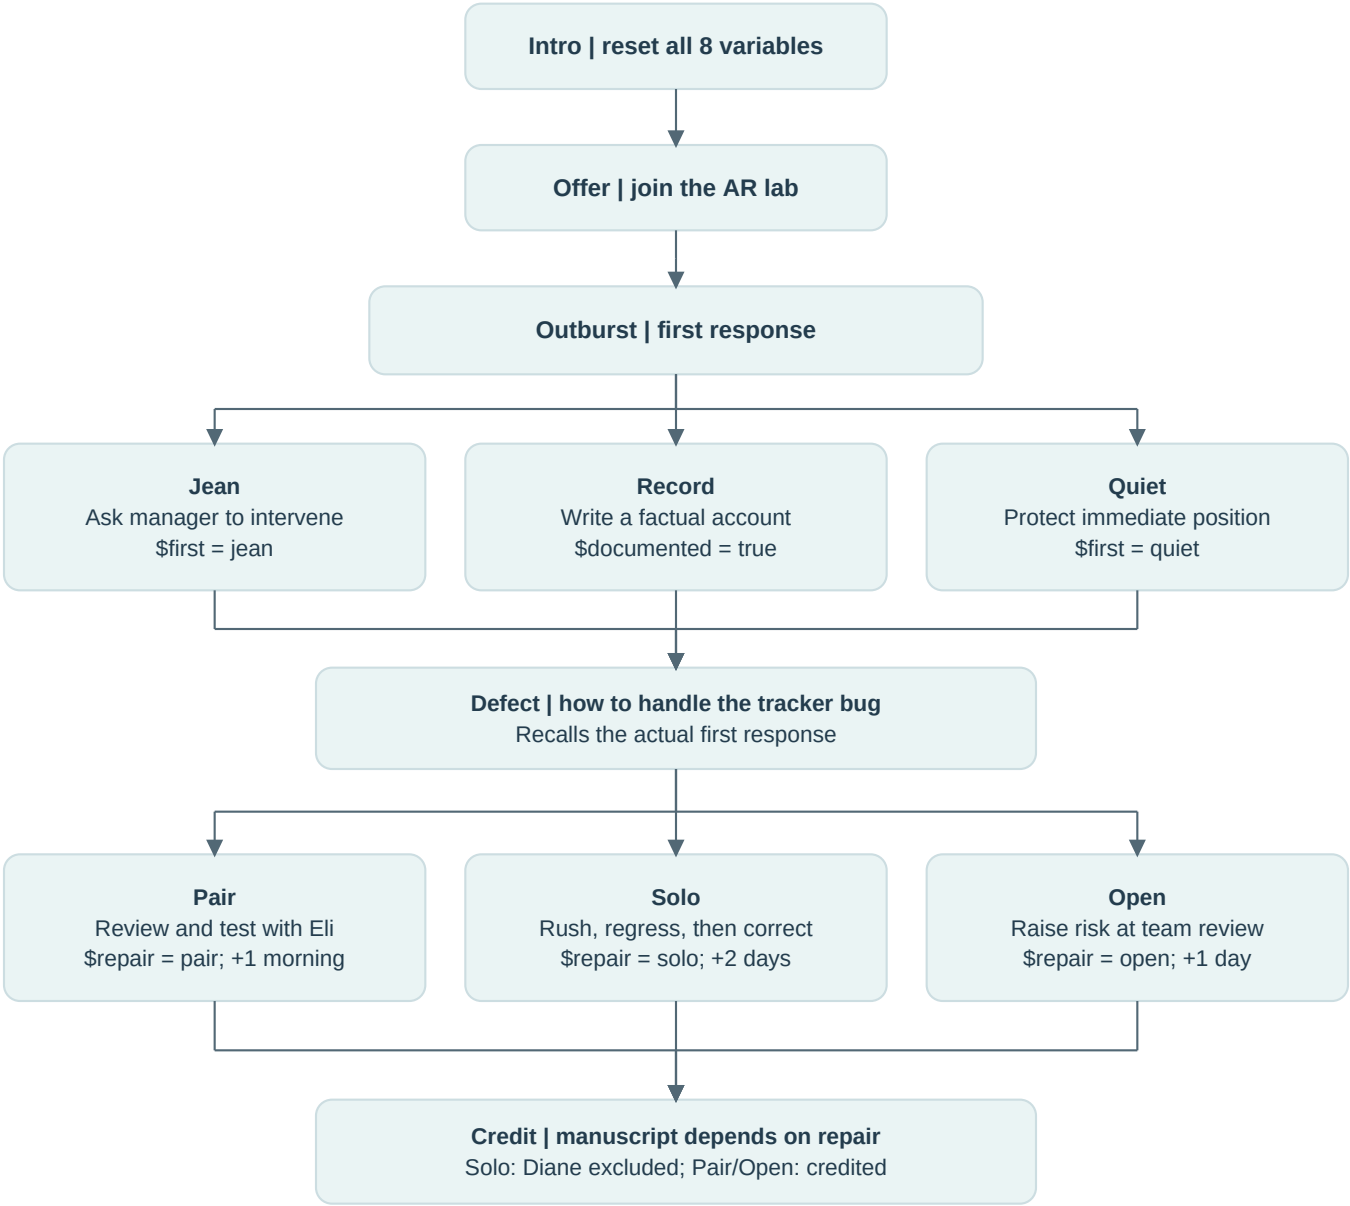


Original annotations: report outcomes depend on information and corroboration, with no guaranteed victory. Endings include ACM reflections and restart. Separate final diagrams follow.

IMPLEMENTED PASSAGES / FIRST RESPONSE AND TECHNICAL WORK

5. Story Flow | final A

Each box names an actual passage. Arrows follow compiled links; box descriptions label the important choices. The shared Frame header renders automatically and is omitted from navigation.



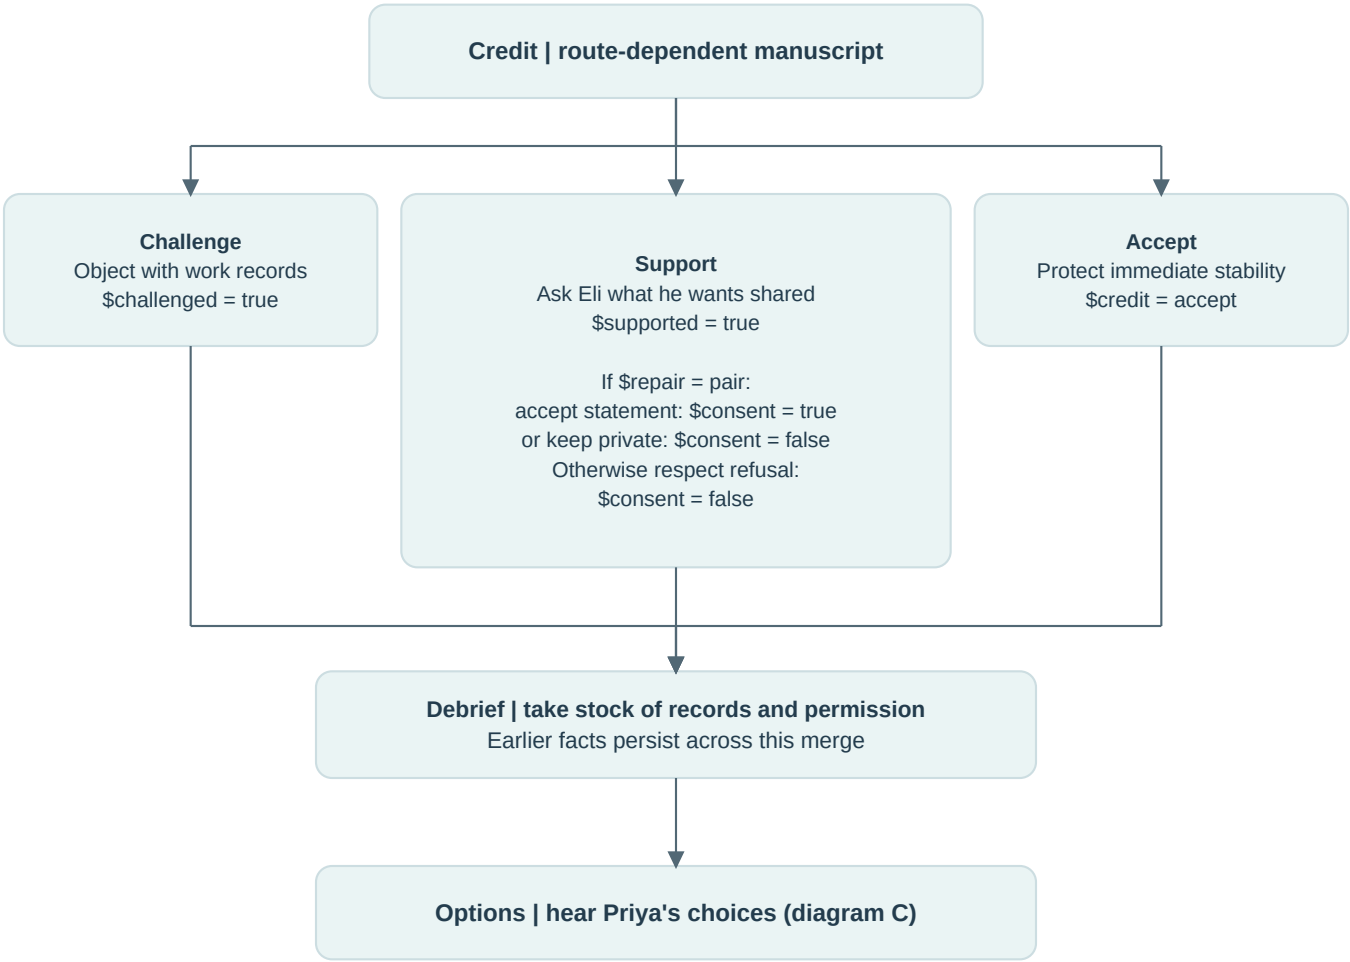
Unchanged: the three responses to abuse and the three approaches to the defect remain as proposed. **Made concrete:** Intro and Offer are separate passages; the first response is remembered in Defect; every repair route states its testing and delay. A solo regression is corrected before any successful demo.

Notation: $names are internal Harlowe state, not a player-visible score. Record also sets $first = record. No other first response creates an outburst record.

IMPLEMENTED PASSAGES / CREDIT, CONSENT, AND OPTIONS

5. Story Flow | final B

The manuscript varies by earlier technical choice: Solo excludes Diane from authorship while Eli remains credited; Pair preserves both bylines but threatens future credit; Open preserves both while exposing intimidation and unequal-treatment concerns. The next Challenge, Support, and Accept choices use route-specific wording.



Conditional links within Support

After Pair, Eli authorizes one named statement for Priya; the player chooses whether to share it ($consent = true) or keep it private (false). After Solo or Open, Eli refuses a named statement, using route-specific dialogue. Four distinct displayed choice links return to Debrief; a shared destination does not erase their different context or consent.

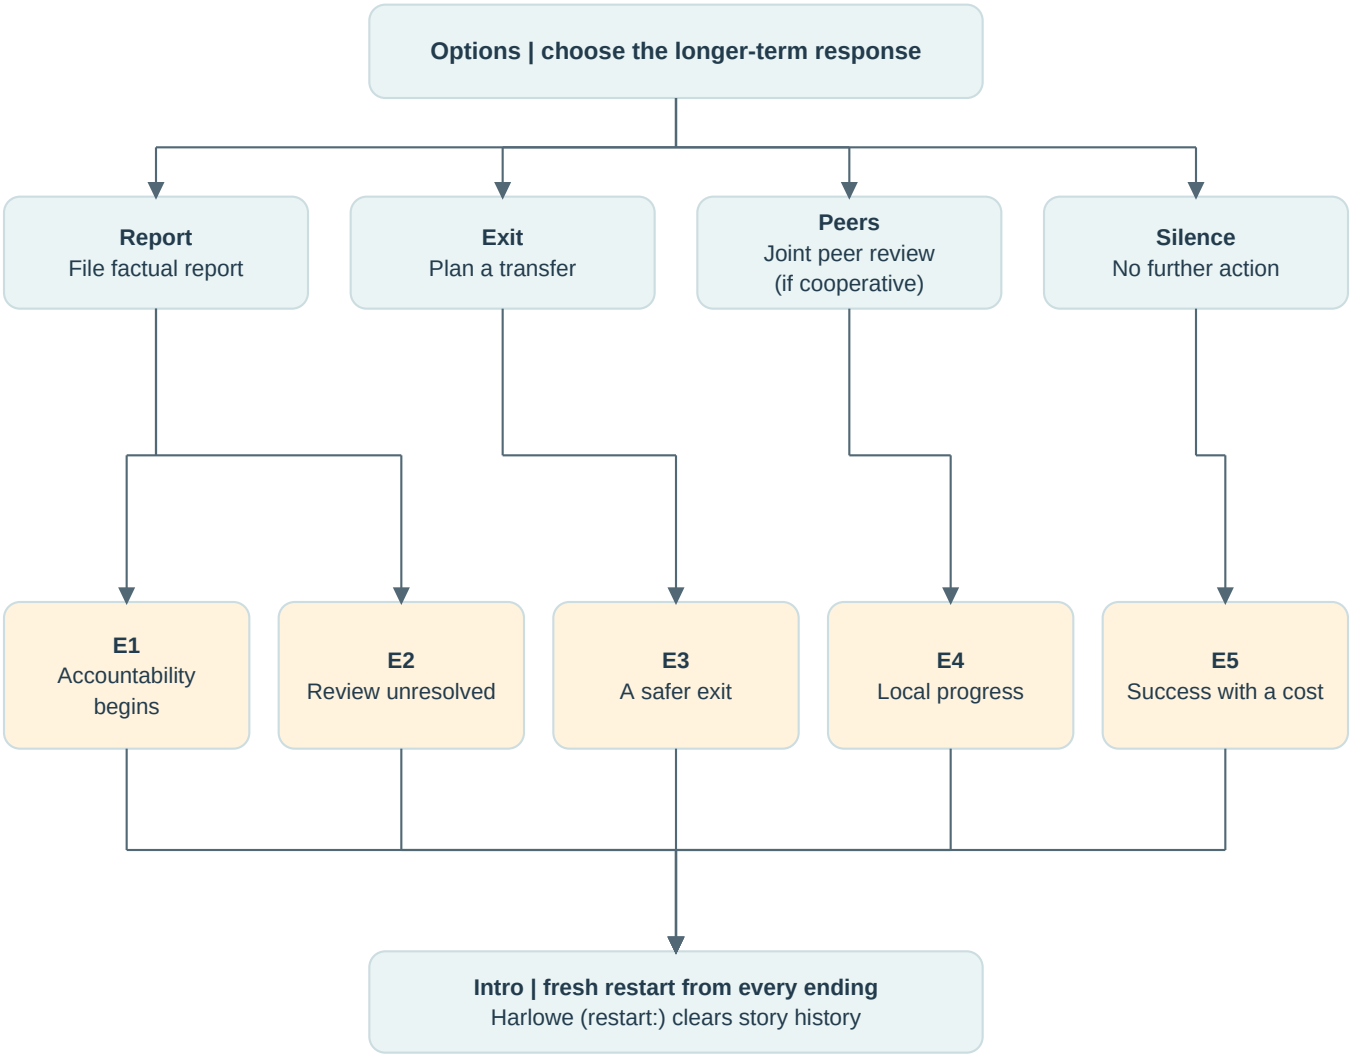
Annotation: Challenge sets $credit = challenge; Support sets $credit = support; Accept sets $credit = accept. Only Challenge sets $challenged. Only Support sets $supported. Debrief separates the outburst note, the authorship objection, and Eli's private account.

Added precision: a limited consent decision and an evidence summary replace an implicit assumption that supporting Eli always provides a statement. Hearing Priya's options is not filing a complaint.

IMPLEMENTED PASSAGES / RESPONSES AND FIVE ENDINGS

5. Story Flow | final C

The final decision has four possible responses, but not every option is available on every route. Report, Exit, and Silence remain available to everyone. Peers requires Pair, Open, or Solo followed by Support. Five endings retain their separate reflections and fresh restart.



State-dependent routes and in-passage choices

Report to E1: ($documented and $challenged) or $consent. **Report to E2:** otherwise. This is an authored fictional branching rule, not a prediction of a real HR process. E1 without Eli's statement includes Jean separately confirming the deferral of the written authorship objection.

Exit to E3: choose a factual exit account ($exitAccount = true) or transfer without it (false). Both reach E3, whose account text changes. The implemented exit is a confirmed transfer after handover; a job search is the contingency discussed in Exit.

Peers to E4: permitted only when $repair is not solo or $supported is true. Cooperation on technical review is independent of consent to share a named statement.

Example route to E2: Quiet, Solo, Accept, then Report. Without an earlier dated record, written objection, or authorized statement, the fictional review remains unresolved.

FIVE DISTINCT OUTCOMES / NO GUARANTEED CLEAN VICTORY

5. Story Flow | consequences

E1 | Accountability begins

An independent review establishes misconduct and initiates management changes. After Solo, Diane's earned authorship is restored; after Pair or Open, her existing authorship remains intact while concerns about threats or unequal treatment are addressed. An experienced interim supervisor takes responsibility for daily reviews. Research is delayed and rebuilding trust remains necessary. ACM 1.5, 3.3, 3.4.

E2 | Review unresolved

An investigation cannot establish every allegation because the available accounts and evidence remain incomplete or disputed. After Solo, Diane's missing credit has not yet been restored; after Pair or Open, authorship remains intact but concerns about intimidation or unequal treatment remain unsettled. Diane receives temporary reporting arrangements while the investigation continues. ACM 1.2, 3.4.

E3 | A safer exit

Diane transfers to another technical group after a handover, preserving her salary but losing the opportunity to continue in the prestigious AR lab. The authorship situation remains consistent with her earlier repair decision. She can choose whether to leave an exit account. Max continues leading the original team, so protecting herself does not resolve the wider problem. ACM 1.2, 3.3.

E4 | Local progress

Diane and Eli introduce two-person reviews, a shared defect log, and a contribution ledger. Technical reliability improves, but Max retains authority and the earlier authorship concerns remain unresolved. This ending is accessible only when Diane previously established or rebuilt technical cooperation with Eli. Peer improvements cannot replace accountable leadership. ACM 2.4, 2.6, 3.3, 3.4.

E5 | Success with a cost

The sponsor demonstration succeeds using a reviewed technical repair, preserving funding and Diane's salary. The exact delay and manuscript situation depend on her earlier repair decision. Max continues intimidating employees, and previously raised objections may remain unanswered. Technical success does not establish that the workplace is ethical or safe. ACM 1.4, 1.5.

What changed, and what did not

After teammate review, all decision buttons now use neutral styling instead of colour-coded hints; the manuscript changes with the earlier repair route, and a joint peer initiative requires cooperation. The supplied initial proposed-flow diagram remains as design history; the final flow diagrams document the implemented changes. The five ending concepts and four major decision stages remain.

WHY MERGED PASSAGES REMEMBER CHOICES

5. Story Flow | state contract

State and initial value	Set by / persistent consequence
$first = none	Jean, Record, or Quiet identifies the first response. Defect and Debrief recall only conversations that occurred.
$documented = false	Record sets true. Debrief and Report distinguish a fresh note from recollection. With $challenged, enables the E1 report route without Eli.
$repair = none	Pair, Solo, or Open records the repair route. Only Solo removes Diane from the paper; Pair/Open preserve her byline. Pair/Open also allow a later joint peer initiative.
$credit = none; $challenged = false	Challenge sets credit=challenge and challenged=true. Support/Accept set the corresponding credit label. The challenged flag preserves the objection in Debrief, Report, and E3-E5. $credit is an explicit route record; the matching flags drive the prose.
$supported = false	Support sets true, enabling a joint peer initiative even after Solo. Conversations affect later text but do not grant testimony consent by themselves.
$consent = false	Only Pair followed by Support and acceptance of the scoped permission sets true. Report shares only that account. It provides an alternate route to E1.
$exitAccount = false	Exit explicitly sets true or false before E3, changing what Priya retains.

Reset and implementation discipline

Intro initializes all eight variables. Each ending uses Harlowe's (restart:) macro, returning to fresh initialization and clearing story history. The canonical Twee source supplies the HTML build; graph.json is generated from its passage links. The final diagrams assert that every distinct source-to-destination pair in graph.json is represented across A-C.

Support has four conditional choice links to Debrief; Exit has two links to E3. Their variants are annotated instead of drawn as overlapping arrows. The Mermaid export retains each compiled link. The Options-to-Peers edge is conditional on $repair is not solo or $supported. Graph edges alone do not imply unconditional reachability.

Visual and interaction design

The AR-office interface uses the same neutral style for all choice buttons, so colours do not suggest a preferred answer. Scene backgrounds add atmosphere; the different ending backgrounds distinguish outcomes only after the player has chosen. Readable typography, labelled dialogue, responsive spacing, and visible keyboard focus support navigation. There is no timer, moral score, or required remote media. The playable HTML embeds the Harlowe runtime.

REAL CONTRIBUTIONS / CONFIRMATION REQUIRED

6. Team Contributions

The supplied roles on page 1 are known. They do not establish actual percentages or who developed a particular perspective. Proposed allocations in the initial plan are not evidence of completed work.

Design section	Kazi Boni Amin	Krrish Setia	Andy Wang	Actual total	Required total
Scenario Description	Pending	Pending	Pending	Pending	100%
Characters	Pending	Pending	Pending	Pending	100%
Ethical Dilemmas	Pending	Pending	Pending	Pending	100%
Lesson Goals	Pending	Pending	Pending	Pending	100%
Story Flow	Pending	Pending	Pending	Pending	100%

Perspective-element ownership

Kazi Boni Amin: Awaiting team confirmation: identify the perspective-element actually contributed and a specific example or passage.

Krrish Setia: Awaiting team confirmation: identify the perspective-element actually contributed and a specific example or passage.

Andy Wang: Awaiting team confirmation: identify the perspective-element actually contributed and a specific example or passage.

Exactly what the team needs to supply

Provide each member's actual percentage for each of the five rows, with every row totaling 100%, and identify each person's actual perspective-element(s), with a concrete passage or example. Edit source/team_contributions.csv and source/perspective_notes.json, then rerun source/generate_pdf.py. Blank data remains visibly pending; the script validates completed percentage rows and does not invent missing values.

Sources and attribution

Assignment authority: the team-supplied CMPT 376W rubric and design instructions. **Design baseline:** the unchanged G15_Initial_Design_and_Build_Plan.pdf preserved under the repository's 01_Design folder. This PDF describes the revised final design while preserving the original proposal as design-process evidence.

ACM source case: Abusive Workplace Behavior. **Code:** ACM Code of Ethics and Professional Conduct. **Accessible principle index:** ACM chapter Code of Ethics. Direct automated retrieval of the main case and Code returned HTTP 403 during this build; the case premise is attributed using the supplied handoff. No claim is made to have read a fully retrieved case page or to quote its text.

Technical references: Twine editor reference; Harlowe manual; IF Technology Foundation Twine/Twee specifications. Local build instructions, runtime license, and actual checks accompany the package.
